

SYSTEM AND METHOD FOR ANALYZING LOGFILES

ABSTRACT OF THE DISCLOSURE

A system and method are disclosed for providing security for a computer
5 network. Content sets are generated for a computer associated with the network. It is
determined whether a user should be routed to the generated content sets. If it is
determined that the user should be routed to the generated content sets, a generated
content set is selected and the user is so routed. Various actions and events may be
recorded in a logfile, and the logfile is analyzed using regular expressions.
